

Tejas AI — 60-Second Elevated Pitch

The 30 · 40 · 30

60 seconds total. Three acts. One laptop. One wow moment.

30% = Hook (18 sec) · **40%** = Wow (24 sec) · **30%** = Close (18 sec)

The structure (why this works)

Act	Time	%	Job
HOOK	0:00 → 0:18	30%	One question. One real crisis. They feel the pain before you name the product.
WOW	0:18 → 0:42	40%	Show, don't tell. Heat wave. AI beats dumb BMS. Live. Their jaw drops here.
CLOSE	0:42 → 1:00	30%	Proof frame. Zero risk. One line they'll repeat in the elevator.

Rule: The wow act is **live demo** — not a slide. You talk *while* the twin moves.

THE SCRIPT — word for word (~155 words · ~60 sec)

Stage directions in italics. Bold = punch the word.

ACT 1 — HOOK · 30% · 0:00–0:18

Stand still. Eye contact. No laptop yet.

“What did your building know last night — that you didn’t?”

Pause. Two beats.

Your BMS knew the chiller was dying. Your weather feed knew **Thursday is forty-seven degrees**. Chennai. Cold storage. Factory floor. **Same story**.

The data was there. **The story wasn’t.**

Turn to screen. Hand on keyboard. Energy shifts.

ACT 2 — WOW · 40% · 0:18–0:42

Open <https://localhost:7878/datacenter> — sim already running

This is **Tejas** — तेजस् — the AI brain for cooling. **Watch.**

Drag weather to **47°C** — or say aloud:

“Heat wave. Push outside to forty-seven.”

Sky turns red. Baseline power bar spikes. Tejas bar stays low. Point at the gap.

See that gap? **Same safety band. Twenty-eight percent less power.** The dumb controller panics. **Tejas predicts.**

Type or say:

“Is any machine going down?”

GPU-16 rack pulses red in 3D. Service email appears.

Rack sixteen — dying **fourteen months** before your inspector walks the floor. **Parts list. Work order. Done.**

This is the wow. Don’t rush it. Let the gap breathe for one second.

ACT 3 — CLOSE · 30% · 0:42–1:00

Step back from screen. Back to eye contact.

Everything you just saw — **one laptop. Fully offline.** We prove it on **your** data first: thirty days, read-only, zero rip-and-replace.

We don’t sell dashboards. **We sell rupees off your power bill** — before the outage, before the inspection, before two fourteen AM.

What did your building know last night? Let’s make sure you know it **tonight.**

Stop. Silence. Don’t fill it.

Timing card (rehearse with a phone timer)

0:00 "What did your building know last night..."
0:05 "...that you didn't?" [PAUSE]
0:08 BMS · 47° · Chennai · same story
0:15 "The story wasn't." → open laptop
0:18 "This is Tejas. Watch."
0:22 Drag to 47°C / voice command
0:26 Point at savings gap — HOLD 1 SEC
0:30 "Is any machine going down?"

0:35 GPU-16 red · parts · work order
0:42 "One laptop. Fully offline."
0:48 "Your data. Thirty days. Read-only."
0:52 "Rupees off your power bill"
0:57 "What did your building know last night?"
1:00 STOP.

The wow moment — exactly what must land

If they remember **one thing**, it's this:

47°C outside	→	baseline PANICS	→	power bar SPIKES
		Tejas HOLDS	→	gap WIDENS

Same green safety band. 28% less energy.
+ GPU-16 pulsing red. "Fourteen months early."

Pre-load before you speak: sim warm, PUE visible, weather at 43°C so the jump to 47°C is instant.

Elevated delivery notes

Do	Don't
Pause after the opening question	Rush into product name
Point at the savings gap — physical gesture	Read slides
Let silence sit 2 sec after GPU-16 reveal	Apologise for the demo
Say "Watch" once — then show	Explain MPC, BACnet, twin architecture
End on the same question you opened with (bookend)	Trail off with "happy to answer questions"

Vocal rhythm: Hook = slow, low. Wow = energy up, short sentences. Close = slow again, certainty.

One-breath version (if cut to 45 sec)

What did your building know last night that you didn't? Your BMS knew the chiller was dying. The data was there — the story wasn't. *[demo: 47°C, gap widens, GPU-16 red]* Same safety. Twenty-eight percent less power. One laptop. We prove it on your data in thirty days, read-only. We sell rupees off your power bill — before two fourteen AM.

Variants

Investor (swap one line in CLOSE)

Phaidra proved AI-run cooling works — for hyperscalers. **We’re the on-prem brain for everyone they ignore.** Savings-share. You pay only from money you weren’t going to have.

Customer / facility head (swap one line in HOOK)

What was your power bill last July — and what almost tripped? Your BMS knew. The story wasn’t.

Hindi closer (optional last 5 sec — only if audience is Hindi-first)

“आज रात आपकी बिल्डिंग क्या जानती है— जो आप नहीं?”

Pre-flight (non-negotiable)

- ☐ `./run.sh` tested **same day**
 - ☐ Weather slider at **43°C** before you walk in
 - ☐ Chat tested: “*Is any machine going down?*” → GPU-16
 - ☐ Phone timer rehearsed 5× — you finish at 0:58–1:02
 - ☐ Recorded backup clip if the room kills Wi-Fi
-

The line they repeat

“What did your building know last night that you didn’t?”

That’s the pitch. Everything else is proof.

Pair with: *pitch.md* (full playbook) · *Tejas-AI-Pitch-Deck.pptx* (slide 2 = this hook)
